## Foreword

Energy is fundamental to human development from industrial revolution to contribution to near-continuous economic growth of recent times, the part played by energy as an enabler of modern development and growth can only be described as 'Foundational'.

In 2015, 193 Member States of the United Nations including India, committed to the Post-2015 Development Agenda, adopted with the motto of "No one left behind" and pledging to make our world more prosperous, inclusive, sustainable and resilient. The Goal-7 thereof acknowledges the role of access to affordable, reliable and modern energy services for sustainable path to prosperity and welfare of the most vulnerable.

Deploying renewables and energy-efficient technologies can spur innovation besides reinforcing local, regional and national industrial and employment objectives. In India, ensuring Indian citizens have access to power and clean cooking by shifting to renewable and efficient modern energy systems; has been at the top of the country's policy initiatives. Hon'ble Prime Minister of India echoed this sentiment at the UN Summit 2015 recognizing that "We are focusing on the basics: housing, power, water and sanitation for all – important not just for welfare, but also for human dignity".

This publication of Energy Statistics, the 30<sup>th</sup> in the series, presents an integrated database on Energy Statistics in the country against the financial year 2021-22. Keeping in view the importance of collated statistics of energy resources, this repository serves as a vital instrument in providing a holistic picture of the changing energy scenario of the country. The data in the publication is sourced from different subject Ministries/Departments of the Government of India including Ministry of Power, Ministry of Coal, Ministry of Petroleum & Natural Gas and Ministry of New and Renewable Energy etc.

The publication presents a wide portfolio of data on reserves, capacity, production, trade, prices, consumption and energy efficiency parameters and also incorporates environmental impacts of energy systems from the combustion of fuels and fugitive emissions which impact climate changes and stability of different ecosystems.

I hope the publication provides requisite evidence to the policy makers in the field of Energy for formulation of key approaches and the needed course corrections on the pathway to sustainable and reliable energy for all.

09<sup>th</sup> March 2023

## Abbreviations and Acronyms

---

<b>ATF</b>	Aviation Turbine Fuel
<b>BCM</b>	Billion Cubic Metres
<b>BT</b>	Billion Tonne
<b>CAGR</b>	Compound Annual Growth Rate
<b>CBFS</b>	Carbon Black Feed Stock
<b>CPEs</b>	Centrally Planned Economies
<b>EMEs</b>	Emerging Market Economies (includes countries of South & Central America, Africa, Middle-east, Non-OECD Asia & Non-OECD Europe)
<b>F.O.</b>	Furnace Oil
<b>GW</b>	Giga Watt
<b>GWh</b>	Giga Watt Hour
<b>SHP</b>	Small Hydro Power
<b>HSDO</b>	High Speed Diesel Oil
<b>IAEA</b>	International Atomic Energy Agency
<b>IEA</b>	International Energy Agency
<b>IOC</b>	Indian Oil Corporation
<b>IRES</b>	International Recommendations on Energy Statistics
<b>KToE</b>	Kilo Tonne of oil Equivalent
<b>KW</b>	Kilowatt
<b>KWH</b>	Kilo Watt Hour
<b>LDO</b>	Light Diesel Oil
<b>LNG</b>	Liquefied Natural Gas
<b>LPG</b>	Liquefied Petroleum Gas
<b>LSHS</b>	Low Sulphur Heavy Stock
<b>Lubes</b>	Lubricant
<b>MJ</b>	Mega-joules
<b>MMSCM</b>	Million Metric Standard Cubic Metres

---

---

<b>MS/MOGAS</b>	Motor Spirit/Motor Gasoline
<b>MT</b>	Million Tonne
<b>MTBE</b>	Methyl Tert-Butyl Ether
<b>M.T.O.</b>	Mineral Turpentine Oil
<b>MTY</b>	Million Tonne Per Year
<b>MW</b>	Megawatt
<b>N.C.W.</b>	Non-communist World
<b>O.E.C.D.</b>	Organization for Economic Cooperation & Development
<b>O.P.E.C.</b>	Organization of Petroleum Exporting Countries
<b>(P)</b>	Provisional
<b>PJ</b>	Peta-joules
<b>PEC</b>	Per Capita Energy Consumption
<b>PET-COKE</b>	Petroleum Coke
<b>SBPS</b>	Special Boiling Point Spirit
<b>SDG</b>	Sustainable Development Goal
<b>SEEA</b>	System of Environmental Economic Accounting
<b>SKO</b>	Superior Kerosene Oil
<b>SNA</b>	System of National Accounts
<b>TEC</b>	Total Energy Consumption
<b>TFC</b>	Total Final Consumption
<b>TPES</b>	Total Primary Energy Supply
<b>TMT</b>	Thousand Metric Tonne
<b>TMTPA</b>	Thousand Metric Tons Per Annum
<b>VGO</b>	Vacuum Gas Oil

## Table of Contents

<b>Section</b>	<b>Page Nos.</b>
Introduction	1
Chapter-1: Reserves and potential for generation	5
Chapter-2: Installed capacity and capacity utilization	13
Chapter-3: Production of Energy Resources	25
Chapter-4: Foreign Trade and Prices of Energy Resources	37
Chapter-5: Availability of Energy Resources	43
Chapter-6: Consumption of Energy Resources	49
Chapter-7: Energy Balance and Sankey Diagram	65
Chapter-8: Sustainability and Energy	77
Annexure-I: Definitions of Energy Products and associated concepts	84
Annexure-II: Measurement Units in Energy Statistics	93
Annexure-III: Metadata: Publication	96
Annexure-IV: Sustainability Energy Indicators of Economic Dimension	100
Annexure-V: Energy Balance Table of India from 2012-13 to 2019-20 (Based on Domestic Conversion Factors and Final, Audited data)	105
Annexure-VI: Energy Indicators of India for Sustainability from 2012-13 to 2020-21 (Based on Domestic Conversion Factors and Final, Audited data)	113
References	114

# Introduction

## **Introduction**

The history of human evolution rests on the availability and use of energy. From the transformation from the early use of fire and animal power that improved lives, to the present world with use of electricity and cleaner sustainable fuels for a multitude of purposes - energy has been the enabler of development. Energy presents a fundamental need ranging from, but not limited to, the essential services of cooking, heating, cooling, lighting, mobility, and operation of appliances, to information and communications technology, and machines in every sector of every country. The lack of access to reliable and clean energy supplies is now considered as a major barrier to improving human well-being around the globe.

In response to increasing concerns about the effect of anthropogenic greenhouse gases on global climate, international action has agreed to reduce emissions. Renewable energy is being explored with renewed commitments as an intelligent solution to be tapped for addressing challenges such as poverty and global warming. If the world is to develop sustainably, it has been recognised that it is then necessary to secure access to affordable, reliable, sustainable, and modern energy services while reducing greenhouse gas emissions and the carbon footprint of the energy sector.

For well-balanced analysis of the energy situation of a country, it becomes imperative to compile the energy statistics for a greater understanding and course-correction to the pathway to sustainability.

However, not all energy is an object of statistical observation. Energy existing in nature and not having a direct impact on society is not measured and monitored as part of energy statistics conventionally. Energy statistics are a specialized field of statistics whose scope has been evolving over time and broadly covers (i) extraction, production, transformation, distribution, storage, trade and final consumption of energy products and (ii) the main characteristics and activities of the energy industries. Energy statistics are seen as a multipurpose body of data.

Energy resources refer to "all non-renewable energy resources of both inorganic and organic origins discovered in the earth's crust in solid, liquid and gaseous form." Energy reserves are part of the resources that, based on technical, economic and other relevant (e.g., environmental) considerations, could be recovered and for which extraction is justified to some extent.

The term products are understood in the same way as in economic statistics where it refers to all goods and services that are the result of production.

Energy products are a subset of products. As a general guideline, energy products refer to products exclusively or mainly used as a source of energy. They include forms of energy suitable for direct use (e.g., electricity and heat) and energy products that release energy while undergoing some chemical or other process (including combustion). By convention, energy products also include peat, biomass and waste when and only when they are used for energy purposes.

Since a number of energy products are transformed into other kinds of energy products prior to their consumption, a distinction is made between primary and secondary energy products. This distinction is necessary for various analytical purposes, including for avoiding the double-counting of energy production in cross-fuel tabulations, such as energy balances. Energy products can be obtained from both renewable (e.g., solar, biomass, etc.) and non-renewable sources (e.g., coal, crude oil, etc.).

The description of the boundary of the universe of energy products in energy statistics is not always straightforward. For example, different forms of corn/corncobs are: (1) combusted directly to produce heat; (2) used in the production of ethanol as a biofuel, (3) consumed as food, or (4) thrown away as waste.

Countries, often in the delineation of energy products, follow the International Recommendations on Energy Statistics or the IRES.

The United Nations Statistical Commission, at its forty second session (22–25 February 2011), adopted IRES as a statistical standard and encouraged its implementation in all countries. IRES provide a comprehensive methodological framework for the collection, compilation and dissemination of energy statistics in all countries irrespective of the level of development of their statistical system. In particular, IRES provides of a set of internationally agreed recommendations covering all aspects of the statistical production process, from the institutional and legal framework, basic concepts, definitions and classifications to data sources, data compilation strategies, energy balances, data quality issues and statistical dissemination.

As per the IRES 2011, recommended unit of dissemination for main categories of energy products are:

**Recommended units for dissemination**

Energy products	Dimension	Unit
Solid fossil fuels	Mass	Thousand metric tons
Liquid fossil fuels	Mass	Thousand metric tons
(Liquid) Biofuels	Mass/Volume	Thousand metric tons/ Thousand cubic metres
Gases	Energy	Terajoules
Wastes	Energy	Terajoules
Fuelwood	Volume/ Energy	Thousand cubic metres/ Terajoules
Charcoal	Mass	Thousand metric tons
Electricity	Energy	GWh
Heat	Energy	Terajoules
Common unit (e.g., balances)	Energy	Terajoules
Electricity installed capacity	Power	MW
Refinery capacity	Mass/time	Thousand metric tons/year

Source: IRES, 2011, United Nations

## Energy Flows

In the context of basic energy statistics and energy balances, the term “energy flow” refers to the production, import, export, bunkering, stock changes, transformation, energy use by energy industries, losses during the transformation, and final consumption of energy products within the territory of reference for which these statistics are compiled. This territory generally corresponds to the national territory; however, it can also refer to an administrative region at the sub-national level or even to a group of countries. The term “rest of the world” is used here to denote all areas/territories outside the reference territory. The broad sectoral diagram representation of Energy Flow in an economy is presented below.

Diagram of the main energy flows

Source: IRES, 2011, United Nations

The present publication, Energy Statistics India 2023, is fully compliant with the IRES 2011 and follows the practices prescribed therein.

The publication in its various chapters presents the concepts of production, consumption, trade, energy balance etc. The data is collected from various line Ministries/Departments of Government of India including Ministry of Coal, Ministry of Petroleum and Natural Gas, Ministry of Power, Ministry of New and Renewable Energy etc. Chapter 1 presents the reserves and potential for generation in the country, Chapter 2 focuses on Installed Capacity and capacity utilization, Chapter 3 gives the production statistics of various energy resources and products, Chapter 4 adds up the statistics on imports-exports and prices in the scenario, the final availability of energy in the country is then given in Chapter 5, and Chapter 6 highlights the consumption of energy sector/industry wise. The overall energy balance combining information of all the previous chapters is presented in Chapter 7 of the publication while chapter 8 looks at sustainability in energy.

This publication, the 30<sup>th</sup> in the series, is an updated and integrated repository of statistics on energy resources and highlights the India's commitment and the progress made so far in the area of reliable, sustainable and efficient energy systems in the country.

# Reserves and Potential for Generation

# **CHAPTER 1**

## ***Reserves and potential for generation***

### **Reserves and Potential**

Energy reserves are part of the energy resources that, based on technical, economic and other relevant (e.g., environmental) considerations, can be recovered and for which extraction is justified. The exact definition of reserves depends on the kind of resources in focus.

Globally, the United Nations Framework Classification for Fossil Energy and Mineral Reserves and Resources (UNFC 2009) provides a scheme for classifying and evaluating these resources according to three dimensions, namely, their economic and social viability, the field project status and feasibility, and the geological knowledge about these resources. System of Environmental Economic Accounting (SEEA)-Energy groups the detailed categories of UNFC into three aggregated classes characterizing the commercial recoverability of the resources as follows:

Categorization of mineral and energy resources relevant for energy
<b>Class A: Commercially recoverable resources</b>
<b>Class B: Potentially commercially recoverable resources</b>
<b>Class C: Non - commercial and other known deposits</b>

Thus, primary energy production relies on the capture or extraction of fuels or energy from natural energy flows, the biosphere and natural reserves of fossil fuels within the national territory in a form suitable for use mostly when extraction and sale have been confirmed to be economically viable.

A good measure of the overall resource and the geographical and technical potential of what can be produced is also often represented by the potential in case of renewable power.

India has one of the largest proven coal reserves in the world. However, one of the objectives of India's energy mix has been to promote the production of energy through the use of renewable energy sources in accordance with climate, environment and macroeconomic considerations in order to reduce dependence on fossil fuels, ensure security of supply and reduce emissions of CO<sub>2</sub> and other greenhouse gases.

This chapter presents data on these reserves and potential in a concise form.

## Highlights

- India has rich deposits of coal in the world. Total estimated reserves of coal as on 01-04-2022 were 361.41 billion tonnes, an addition of 9.28 billion tonnes over the corresponding period of previous year. In terms of percentage, there has been a growth of 2.64% in the total estimated coal reserves during the year 2021-22 over 2020-21 (Table 1.1.).
- The top three states with highest coal reserves in India are Odisha, Jharkhand, Chhattisgarh, which account for approximately 69% of the total coal reserves in the country.
- Out of the total reserves in the country, proven reserves i.e. those available for extraction in terms of i.e. economically viability, feasibility study and geologically exploration level, account for almost 52% of the total as depicted below in Fig 1.1.

- Total estimated of lignite as on 01-04-2022 were 46.20 billion tonnes, an addition of 0.18 billion tonnes over the corresponding period of previous year. In terms of percentage, there has been a growth of 0.39% in the total estimated lignite reserves during the year 2021-22 over 2020-21 (Table 1.1A). The highest reserves of lignite are found in the state of Tamil Nadu. Out of the total Lignite reserves in the country, proven reserves account for almost only 16% of the total as depicted below in Fig 1.2.

\* Brief about the Proved, Inferred and Indicated has been given under **Annexure - I**.

**Fig 1.2 Estimated Reserves of Lignite in India as on 01.04.2022**

**Total Estimated reserves = 46.20 Billion Tonnes**

- The estimated reserves of crude oil in India as on 01-04-2022 stood at 651.77 million tonnes against 591.92 million tonnes in the previous year. An increase of over 10% over last year. Geographical distribution of Crude Oil indicates that the maximum reserves are in the Western Offshore (33%) followed by Assam (23%) (Table 1.2).

**Fig 1.3: Estimated Reserves of Crude Oil in India as on 01.04.2022**

- The estimated reserves of Natural Gas as on 01-04-2022 was at 1138.67 Billion Cubic Meters. The maximum reserves of Natural Gas are in the Western Offshore (29.6%) followed by Eastern offshore (23.6%).

**Fig 1.4 : Estimated Reserves of Natural Gas in India as on 01.04.2022**

- There is a high potential for generation of renewable energy from various sources like wind, solar, biomass, small hydro and cogeneration bagasse in India. The total potential for renewable power generation in the country as on 31.03.2022 is estimated at 14,90,727 MW This includes solar power potential of 7,48,990 MW (50.24%), wind power potential of 6,95,509 MW (46.66%) at 120m hub height, SHP (small-hydro power) potential of 21,134 MW (1.42%), Biomass power of 17,538 MW (1.18%), 5,000 MW (0.34%) from bagasse-based cogeneration in sugar mills and 2,556 MW (0.17%) from waste to energy (Table 1.3).

**Fig 1.5: Source wise Estimated Potential of Renewable Power in India as on 31.03.2022**

- The geographic distribution of the estimated potential of renewable power as on 31.03.2022 shows that Rajasthan has the highest share of about 18.2% (271219 MW). This is followed by Gujarat with 12.1% (share 180215 MW). Maharashtra and Karnataka come next with a 11.2% and 10.3% share (166743MW and 154162 MW respectively). These four (4) states are having more than 50% of the total potential of Renewable Power in India.

**Fig 1.6: Statewise Estimated Potential of Renewable Power in India as on 31.03.2022**

**Table 1.1: Statewise Estimated Reserves of Coal ( as on 01<sup>st</sup> April )**

(in Million Tonnes)

# Installed Capacity and Capacity Utilization

## **CHAPTER 2**

### ***Installed capacity and capacity utilization***

#### **Installed capacity**

The world in its commitment to sustainability has pledged to expand infrastructure and upgrade technology for supplying modern and sustainable energy services for all in developing countries (SDG Target 7.B).

Development of an Energy systems which is capable of delivering to the ever growing and emerging needs of developing economies, is the need of the hour. Growing energy demands world over and in the densely populated regions of Asia including India have driven the need to shift to cleaner fuels and lager energy systems.

Thus, in India, there has been a thrust to increase installed generating capacity of power and to decrease the reliance on primary fossil fuels to cater to these needs. Generating and providing reliable power at competitive prices in a sustainable manner by optimising the use of multiple energy resource with innovative eco-friendly technologies has been at the core of policy planning in India. Also, the environmental and health burdens arising out of the use of hydrocarbons force the world towards adopting energy efficiency and clean energy systems.

It is worthy to note here that not all potential is viable to be transformed into capacity, and overall capacity does not lead to an equal amount of generation due to production losses etc. Power plants have a capacity to produce a certain amount of power during a given time, but if they are taken offline (i.e. for maintenance or refuelling) then they are not actually generating power.

This chapter presents the capacity of coal washeries, oil refineries and electricity.

## Highlights

- Total installed capacity of coal washeries in India is 152.31 Million Tonne per year (MTY) as on 31.03.2022 (P). This comprises of 37.18 MTY in coking and 115.13 MTY in Non-Coking Coal Washerries (Table 2.1).
- Similarly, as on 31.03.2022, there were a total of 23 refineries in the country, 19 in the Public Sector, 4 in the Private sector and Joint Venture (Table 2.2).
- The refining capacity of the country is 2,51,216 TMTPA on 31.03.2021 which is 2000 TMTPA more than from the last year. Public sector refineries have the dominance of over 60% of the total capacity in India.
- The Refinery production (crude throughput) achievement was 2,21,773 TMT during 2020-21 which has increased to 2,41,703 TMT during 2021-22 i.e. a net increase of 9% over 2020-21.
- Hence, the overall Capacity utilization of the refineries which was 88.76% during 2020-21 has increased to 96.99% in 2021-22. In the Public Sector, Indian Oil Corporation (IOC) increased its capacity utilization from 89.46% in 2020-21 to 96.60% in 2021-22. The Private and Joint venture, have also experienced positive growth rate of 8.17% during FY:2021-22 over the previous year.
- In absolute terms, the installed capacity of electricity generation increased by 4.68% to 4,82,232 MW in 2021-22 over 4,60,659 MW in 2020-21 with the major share of installed capacity existing with utilities i.e. 82.84% (Table 2.3).

**Fig 2.1:Trends in Installed Electricity Generation Capacity (MW) in India during the period 2012-13 to 2021-22 (P)**

- India's Energy mix has been seeing a shift from more conventional resources of energy to renewable sources. The financial year 2021-22 has witnessed a growth of 16.4% over last year in the installed capacity of RES (Renewable Energy Sources, other than Hydro) under utility; while that of thermal sources grew only at 0.06%.

**Fig 2.2: Trends in Installed Electricity Generation Capacity from Utilities (MW) in India - Sourcewise during the period 2012-13 to 2021-22 (P)**

- The geographical distribution of installed capacity of electricity generating as on 31.03.2022 indicates that Western Region accounted for the highest share (34%) followed by Southern Region (28%) and Northern Region (26%). Northern Region also accounted for the highest share of hydro energy. Among states, the state of Karnataka has the highest share of hydro installed capacity of 3.63 GW and Rajasthan has the highest share of Other renewable resources of 16.70 GW. (Table 2.4).

**Fig 2.3:Regionwise Installed Generation Capacity of Electricity (Utilities) as on 31.03.2022**

- Region wise growth in the installed capacity during 2021-22 reveals that North Region (NR) registered highest annual growth of about 10.75%. The NR has also registered a growth of over 45% in the RES (Renewable Energy Sources) sector. Amongst all the major states Rajasthan registered highest annual growth (35.25%) in the installed capacity.
- The total installed capacity of grid interactive renewable power, which was 95,803 MW in 2021 increased to 1,09,885 MW (a growth of 14.70%) during a year (2022) (Table 2.5).
- Out of the total installed generation capacity of renewable sources of power in 2022, installed capacity of Solar power including roof tops accounted for about 49.1%, followed by Wind power (36.7%) and Bio Power & Waste to Energy (9.7%). However, in terms of growth rates year on year, Solar power installed capacity has a growth rate of 30.95% from FY: 2020-21 to FY: 2021-22.
- Rajasthan had the highest installed capacity of grid connected renewable power (17,040.62 MW) in 2022 followed closely by Gujarat (16,587.90 MW) mainly on account of wind and solar power.

**Fig 2.4 : Sectorwise percentage distribution of Installed Grid-Interactive Renewable Power Capacity during 2021-22(P)**

**Fig 2.5 : Installed Capacity of Grid-Interactive Renewable Power During 2020-21 and 2021-22(P)**

- Again, in case of Off-Grid/De-centralized Renewable Energy System, India has shown a steady growth over periods of time. Installation of solar Street Lightening System (SLS) has experienced a growth of 12.6% over last year. Also, the Solar Photovoltaic Plants (SPV) has registered a growth of 21.9% over last year (Figure 2.6).

**Fig 2.6 : Installation of Off-grid / Decentralised Renewable Energy Systems/ Devices during last 3 years**

## || Chapter - 3 ||

# Production of Energy Resources

## **CHAPTER 3**

### ***Production of Energy Resources***

#### **Production**

Energy production and consequently its' availability directly affects future production, imports, exports and investment, all of which have a significant impact on a country's economy. Detailed and high-quality energy statistics provide policy makers with the information needed to make informed decisions and evaluate possible trade-offs including planning for global price shocks in energy commodities.

Data on production of energy commodities, and stock changes are also required for monitoring national energy security. In a rapidly changing energy scenario of the world in terms of trade, consumption and stock levels, problems with national energy supply often are perceived threatening to national independence, especially if national energy resources do not meet energy demands.

In Energy Statistics, production is defined as the capture, extraction or manufacture of fuels or energy informs that are ready for general use. Two types of production are distinguished, primary and secondary.

Primary production is the capture or extraction of fuels or energy from natural energy flows, the biosphere and natural reserves of fossil fuels within the national territory in a form suitable for use. Inert matter removed from the extracted fuels and quantities reinjected, flared or vented are not included.

Secondary production is the manufacture of energy products through the process of transformation of other fuels or energy, whether primary or secondary. The quantities of secondary fuels reported as production include quantities lost through venting and flaring during and after production.

This chapter presents the production of different energy resources and electricity.

## Highlights

- Coal production in the country during the year 2021-22(P) was 778.19 million tonnes as compared to 716.08 million tonnes during 2020-21. There is an increase of 8.67%. The overall trend of production in the last ten years i.e. 2012-13 to 2021-22(P) has shown a steady increase, except 2020-21, with a CAGR of 3.80% (Table 3.1).
- The Lignite production during 2021-22(P) has been increased to 47.49 million tonnes from the figure of 37.90 million tonnes in 2020-21; an increase of 25.32% over 2020-21(Table 3.1).
- However, the production of crude oil for 2021-22 (P) came out to be 29.69 MT as compared to 30.49 MT during FY: 2020-21 which is a decline of 2.63% (Table 3.1).
- The CAGRs for Crude Oil and Natural Gas, w.r.t FY: 2012-13, are having negative CAGR of -2.66% and -1.97% respectively. Electricity (generated from Hydro, Nuclear and other Renewable energy sources) is having the highest CAGR of 6.83%, showing the remarkable growth of Renewable Energy in India (Table 3.1).

Fig 3.1 : Compound Annual Growth Rate of Production of Energy Resources from 2012-13 to 2021-22(P)

- To allow comparison among and aggregation of production by different sources of energy, production has been converted in terms of energy units, Petajoules. It may be seen that the total production of energy resources has increased from 14,837.60 petajoules during 2020-21 to 16,146.44 petajoules during 2021-22(P), an increase of 8.82% (Table 3.2).

**Fig 3.2: Trends in Production of Energy (in petajoules) by Commercial Sources in India from 2012-13 to 2021-22 (P)**

- India still depends heavily on Coal as the major source of energy. During the FY:2021-22(P) energy generated from Coal accounted for about 72.92% of the total generation of energy followed by Electricity (from Hydro, Nuclear and other Renewable energy sources) (8.24%) and Natural Gas (8.16%).

**Fig 3.3: Share of Total Energy Generated (in petajoules) from different commercial sources in India during FY : 2021-22(P)**

- Within Coal, Public sector has the dominating share in production. During FY: 2021-22 (P) almost 96% of total production has come from public sector. A scenario of performance made by Public and Private sector during past 10 years has been given below,

**Fig 3.4: Share of Private and Public sector in Production of Coal in India during FY : 2012-13 to FY : 2021-22(P)**

- In the year 2020-21, the production of Petroleum Products in the country was 233.51 MT as against 254.31 MT during 2021-22(P), an increase of 8.90%. In the total production of Petroleum Products during 2021-22 (P), High Speed Diesel Oil accounted for the maximum share (42%), followed by Motor Gasoline (16%). (Table 3.4).

**Fig 3.5 : Production of Petroleum Products by type during 2021-22(P)**

- Again, within the three (3) major categories of Petroleum Products, the *Middle Distillates* (which is having the dominant share of 47.3%, contains items like ATF, Diesel, Kerosene etc.) has experienced a growth of 8.6% during 2021-22, over past year. The Heavy Ends sector also has witnessed the highest growth of 15% over last year. A sectorial-overview during last 10 years is given below,

- Net production of Natural Gas for consumption increased from to 27.78 Billion Cubic Meters (BCM) in 2020-21 to 33.13 BCM in 2021-22(P) registering an increase of 19.25%. The Net-Production for sale has also experienced a growth of over 24% in comparison to the last FY. After having a steady decline from the FY: 2012-13, the Net-Production for sale of Natural Gas has increased to 27.37 BCM during FY: 2021-22(P) as compared to 22.05 BCM during FY: 2020-21.

**Fig 3.7 : Trend of Net production (for Sale) of Natural Gas in India during FY: 2012-13 to FY: 2021-22(P)**

- India has experienced a steady growth in terms of gross electricity generation (from Utility) over time except 2020-21. The CAGR grew at a rate of 4.41% in the last ten years from 2012-13 to 2021-22 (P).
- The generation of electricity in India still depends heavily on Coal. During FY:2021-22(P) close to 73% of the electricity has been generated from Steam. However, the RES (Renewable Energy Resources other than Hydro) has shown some good signs as it has registered a growth of 16.07% during FY: 2021-22(P), as compared to 2020-21.

**Fig 3.8: Trends of Generation of Electricity from Utilities and Non-Utilities in India from 2012-13 to 2021-22(P)**

**Table 3.1 : Yearwise Production of Energy Resources in Physical Units**

Year	Coal (Million Tonnes)	Lignite (Million Tonnes)	Crude Oil (Million Tonnes)	Natural Gas # (Billion Cubic Metres)	Electricity* (GWh)

# Foreign Trade & Prices of Energy Resources

## **CHAPTER 4**

### ***Foreign Trade and Prices of Energy Resources***

#### **Trade and Prices**

Many challenges are faced by the developing countries and the international community including ensuring, through national and international measures, that energy is (a) accessible to households and industries; (b) affordable for all, especially the poor; (c) sustainably produced and consumed; and (d) available for promoting development locally and globally.

These challenges coupled with the imperative to mitigate climate change, i.e. “decarbonization” of energy generation and use by households and industries, further intensifies high volatility present in the international energy market, and thus impacts energy importers/exporters countries equally.

Countries need to encourage a more efficient management of energy resources, coupled with an accelerated growth of renewable and sustainable sources of energy. The need of the hour, thus, being an increased investment, development of necessary infrastructure and also improvement in trade regimes in order to achieve self-sufficiency in terms of import dependency.

To holistically mitigate the effects of the situation, Energy policies in India in the recent years have been designed to address the country's growing energy deficit and to focus on developing alternative sources of energy, particularly nuclear, solar, and wind energy. India has been focusing on reducing its dependence on energy imports and diversifying its energy basket. The aim is to achieve Energy security - the continuous availability of energy in varied forms, in sufficient quantities, at reasonable prices, to fuel economic growth in the coming years. Moreover, the international community should promote an enabling environment for the development and utilization of financing mechanisms for exchange of new energy technology and infrastructure for an enabling environment in this sector to thrive.

## Highlights

- There has been an increasing trend in the net import of coal in the recent years. Over the last ten years, the Net Import of coal steadily increased from 143.34 MTs in 2012-13 to 216.54 MTs in 2014-15. This was followed by a marginal decline in the succeeding 2 years but again have started increasing again and reached to 247.51 MTs in 2019-20. However, during 2021-22(P), there is a sharp decline of 2.14% in the Net Import of Coal w.r.t the FY: 2020-21. During FY:2021-22(P), the net-Import of Coal came out to be 207.77 MTs as compared to 212.31 MTs during FY:2020-21.
- India is also highly dependent on imports of crude oil to meet domestic consumption. Imports of crude oil have increased from 184.80 MTs during 2012-13 to 226.95 MTs during 2019-20. But during FY: 2020-21 the same has been reduced to 196.46 MTs, a reduction of 13% over the FY: 2019-20. The same may be due to COVID-19 pandemic. However, during FY:2021-22(P) the fuel import has again experienced a growth of 7.9% and reached at 211.98 MTs.
- India is an exporter of Petroleum Products. The export of petroleum products has increased rather slowly from 63.41 MT during 2012-13 to 65.69 MT during 2019-20. But during FY:2020-21 the same has been reduced to 56.76 MTs which has again rose to 62.71 MT during FY:2021-22(P), registering a growth of close to 10.5%.
- The import of Natural Gas has experienced a steady increase over time. From a figure of 17.61 BCM (Billion Cubic Meter) during 2012-13 to 33.89 BCM during 2019-20 i.e. an increase of over 92% in a span of 7 years. However, the same stood at 30.78 BCM for the year 2021-22(P) as compared to 33.03 BCM in the 2020-21 recording a decline of (-)6.83%. The CAGR of import of natural gas between 2012-13 and 2021-22(P) is having a positive growth rate of 6.40%.
- India's exports of electricity started rising as compared to gross imports since 2016-17. The export of electricity has increased from 153.53 GWh in 2012-13 to 9231.63 GWh in 2021-22(P) with a CAGR of 57.64%.
- India, however also imports a decent amount of electricity to meet its' domestic demand. The Import figure during FY:2012-13 was 4,795 GWh which, after having a decline during FY:2018-19 (4,396 GWh), the Import has displayed a steady growth upto FY:2020-21 having a figure of 9547.70 GWh. However, during FY:2021-22(P) the same has been found to be reduced to 7596.71 GWh, a decline of over 20% in comparison to FY:2020-21. (Table 4.1(Contd.))

# Availability of Energy Resources

## **CHAPTER 5**

### ***Availability of Energy Resources***

#### **Availability**

The availability of and access to energy and energy sources are particularly essential for poverty reduction and further improvements in standards of living.

Data on availability of energy resources within the national territory of a given country during a reference period along with reliable and timely monitoring of the supply and use of energy becomes indispensable for sound decision-making.

Data items, particularly, on mineral and energy resources are important for the assessment of their availability in the environment, as well as for the assessment of their depletion. This information is often used in the compilation of asset accounts in the SNA, as well as in SEEA-Energy accounts to assess their availability in the long run.

More importantly, it is essential for countries to track their depletion of energy related natural resources, as this directly affects their availability for future generations and increasing dependence of an economy on trade to balance the deficit. Thus, there has been a thrust to rely on renewable and cleaner forms of energy in the recent years, world over, - to bridge the gap between demand and supply without affecting the environment drastically.

The necessity of Energy security in the current world and availability of energy being an enabler of life improvement, access and availability of Clean Energy for all has been recognized as an agenda point of the Sustainable Development Goals which are to be achieved by countries till 2030.

This chapter presents the availability of primary energy resources, petroleum products and electricity in the economy.

## Highlights

- Over the year 2021-22 (P), in comparison to the year 2020-21, the availability of energy resources has experienced an increase in all the energy resources except coal. Coal has declined by 1.07% during FY:2021-22(P), in comparison with previous Financial year; the availability of Lignite, Crude Oil and Natural Gas oil has increased by 23.48%, 6.48% and 5.08% respectively during FY:2021-22 (P), w.r.t FY:2020-21. (Table 5.1).
- India, being one of the largest reservoirs of Coal, has displayed a steady increase in availability of Coal during the period from 2012-13 to 2021-22(P) with a CAGR of about 3.59%, except for small decline of 4.61% from 2019-20 and 1.07% from 2020-21. The total availability of Coal in 2021-22(P) stood at 945.78 MT as compared to 956.02 MT in 2020-21 indicating a total decrease of 10.23 MT in a year. Out of the 945.78 MT available for consumption in 2021-22(P), a major portion (82.28%) is produced domestically and 208.93 MT is imported (Table 5.1 & 5.2). An overview of availability of Coal and Lignite in India is given below,

**Fig 5.1: Yearwise Total Availability of Coal and Lignite in India during  
FY : 2012-13 to FY : 2021-22(P)**

**Fig 5.2 : Trend of Production and Import of Coal in India during FY: 2012-13 to FY: 2021-22(P)**

- The total availability of crude oil experienced a downfall of 32.17 MT during FY:2020-21 a decline of close to 12%, primarily because of COVID-19 pandemic. The same, however has bounced back and registered a growth of 6.48% during FY:2021-22(P) over last year (from 226.95 MT in 2020-21 to 241.67 MT during 2021-22(P)). The overall CAGR between 2012-13 to 2021-22(P) has also remained positive (0.91%).

**FIG 5.3: YEARWISE TOTAL AVAILABILITY OF CRUDE OIL IN INDIA DURING FY : 2012-13 TO FY : 2021-22(P)**

- Like in all developing countries, India has also experienced a steady growth rate of Petroleum Products over time. A production of 203.20 MTs in 2011-12 to 262.94 MTs in 2019-20 i.e. an increase of over 29% has been registered. But during 2020-21, primarily because of COVID-19, the same has been decreased to 233.51 MTs, a decline

of 11.19% over 2019-20. The Petroleum Products, however, has experienced a healthy growth of close to 9% during FY:2021-22(P) and has reached to 254.31 in 2021-22(P). The CAGR of total availability of Petroleum products between 2012-13 to 2021-22(P) has shown a growth of 1.74% (Table 5.3).

**FIG 5.4: YEARWISE TOTAL AVAILABILITY OF PETROLEUM PRODUCTS IN INDIA DURING FY : 2012-13 TO FY : 2021-22(P)**

- Electricity available for supply has increased from 9,21,229 GWh in 2012-13 to 14,25,036 GWh in 2021-22(P), thus recording a CAGR of 4.97% during this period. There is also an increase of 8.45% in the availability of electricity (from 13,14,025 GWh during 2020-21 to 14,25,036 GWh) during 2020-21.

## Consumption of Energy Resources

## **CHAPTER 6**

### ***Consumption of Energy Resources***

#### **Consumption**

The study of consumption patterns of energy in any economy is vital to understand how final demand drives energy use or consumption. SEEA – Energy states that “resource uses and environmental pressures, which occur at the level of production, can in fact be viewed as determined by final use, which initiated the production chain”.

Moreover, to fully understand the climate-change process, the data on many consumption activities, such as heating of houses and buildings, usage of electricity, various industrial processes and transportation, which entail combustion processes are required.

Energy-related air emissions are being measured and tracked by global economies, because most economic activities are linked to combustion/consumption that is needed for energy production.

With the increasing focus on sustainable consumption and production patterns world over, resource uses and environmental pressures are being viewed as determinants or drivers of the final use and consumption of products.

According to the International Energy Agency, where India is an Association country since March 2017, Total Energy Consumption (TEC) in an economy is a good indicator of efficient or non-efficient end-use in economic activities and may indicate course-correction measures to sustainability. It is defined to include the sum of the consumption in the end-use sectors and for non-energy use. Energy used for transformation processes and for own use of the energy producing industries is excluded. Thus, final consumption reflects for the most part, deliveries to consumers and represents the quantity of all energy necessary to satisfy inland consumption.

This chapter presents the total consumption of energy resources along with sector wise end use of different energy resources and products in India.

## Highlights

- During the FY: 2021-22, India has experienced a rather slow rate of consumption, mainly because of COVID-19 pandemic, where all the sectors experienced a negative growth rate. But during FY:2021-22, all the sectors have come-up with a healthy growth rates displaying a steady recovery of the Indian economy.

**Fig 6.1 : Growth rate of consumption of Energy Resources during FY:2021-22(P) w.r.t 2020-21**

- India is one of the largest producers and consumer of coal in the world. Though there is a small decline of (-)5.19% in 2020-21 over 2019-20; the consumption has increased by close to 13.5% during FY:2021-22 (Table 6.1 ).

**Fig 6.2 : Yearwise Trend of Production and Consumption of Coal in India during FY:2012-13 to FY:2021-22(P)**

- India has experienced a healthy growth in consumption of Energy. A growth from a figure of 25,805 Petajoule (PJ) during 2012-13 to 33,508 Petajoule (PJ) in 2021-22 (P). The total consumption of energy has increased from 30,354 PJ in 2020-21 to 33,508 PJ in 2021-22(P), an increase of 10.39%. Coal and Lignite together has registered the highest growth of close to 14% during FY:2021-22(P) over last year.

**Fig 6.3 : Trend of total consumption of Energy in India during FY: 2012-13 to FY: 2021-22 (P)**

- The consumption of energy in petajoules from Coal and Lignite was highest which accounted for about 48% of the total consumption during 2021-22(P) followed by Crude Oil (31%) and Electricity (14%) (Table 6.2).

**Fig 6.4: Sourcewise Consumption of Energy during 2021-22 (P)**

- Electricity Sector remains the biggest consumer of Raw Coal and Lignite in India with this sector consuming as much as 69.04% of the total consumption of coal and 78.98% of total consumption of lignite in India in 2021-22(P). (Table 6.3 & Table 6.4)

- Consumption of Lignite has increased from 38.49 MT in 2020-21 to 49.07 MT in 2021-22(P) which is almost 27.49%. The sharp increase can be attributed to the higher demand in Electricity/Power sector during FY: 2021-22(P), which has experienced an increase of 5.82MT over last year (Table 6.4).
- Petroleum products have experienced a steady growth over time. From a figure of 157.06 MTs during 2012-13 to 214.13 MTs during 2019-20 i.e. a growth of 36% over a span of 7 years. However, during FY:2020-21 the same has been decreased by 9.26% and stood at 194.30 MTS primarily because of COVID-19 pandemic. During FY:2021-22(P) the same has shown a positive growth rate of 5.77% and stood at 204.23 MTs. Among all the products the High-Speed Diesel Oil (HSDO) accounted for 37.55% of total consumption. This was followed by Petrol (15.10%), LPG (13.87%), Pet Coke (7.72%) (Table 6.5).

**Fig 6.6 : Trend of total consumption of Petroleum Products in India during FY: 2012-13 to FY: 2021-22 (P)**

**Fig 6.7 : Consumption of Petroleum Products- By type during FY:2021-22(P)**

- Among all the Petroleum Products the HSDO, which has the highest share of consumption (37.55%) during FY: 2021-22(P), experienced a positive growth of 5.47% over last year. The Petrol and Pet-Coke are also having a growth of 10.30% and 1.07% respectively over last year. The LPG has registered a positive growth during FY:2021-22 (p); with a growth of 2.80% over last year it has stood at a figure of 28.33 MTs in 2021-22(P), as compared to 27.56 MTs during 2020-21(Table 6.5).

**Fig 6.8 :Sector-wise consumption of HSDO(High Speed Diesel Oil) during last 5 years**

- The impact of energy policies of recent time is evident on the consumption of kerosene as a fuel in the country. the consumption of Kerosene has seen a steady decreasing trend with a CAGR of (-) 16.42% from 2012-13 to 2021-22(P) (Table 6.5).
- The consumption of Natural Gas, both for energy and non-energy purpose have experienced a fluctuation over time. During FY: 2021-22 the consumption against the Energy purpose has experienced a growth of 14% (from 34,617 BCM during 2020-21 to 39,414 BCM during 2021-22); the Non-Energy purpose has also experienced a meagre growth of 2.7% (from 21,500 BCM during 2020-21 to 22,077 BCM during 2021-22).

**Fig. 6.9: Trend in Percentage Consumption of Natural Gas**

- The maximum use of Natural Gas is in fertilizers industry (28.29%) followed by power generation (15.89%). Industry wise off-take of natural gas shows that, out of the Total Consumption (*Availability Basis (Net Production + LNG Imports)*), while 62% of natural

gas has been used for Energy purposes, 35% is used for Non-energy purposes (Table 6.7).

- The estimated electricity consumption increased from 8,24,301 GWh during 2012-13 to 12,96,300 GWh during 2021-22(P), showing a CAGR of 5.16%. Out of the total consumption of electricity in 2021-22(P), industry sector accounted for the largest share (41.16%), followed by domestic (25.77%), agriculture (17.67%) and commercial sectors (8.29%). The Domestic sector has experienced the highest CAGR of 6.87 between FY:2012-13 to FY:2021-22(P) (Table 6.8).

**Fig 6.10: Consumption of Electricity by Sectors in India during 2021-22(P)**

**Total Electricity Consumption = 12,96,300**

**Fig 6.11: Sector-wise consumption of Electricity during last 5 years**

Note: \*\*: Availability Basis (Net Production+LNG Imports)

P: Provisional

1. Re-classification among the sectors of consumption of natural gas under energy and non-energy sectors, has been done depending on usage. Sectors where natural gas is being used as feedstock are classified

2. Sectorial Sales/consumption of natural gas includes RLNG.

3. Total may not tally due to rounding off.

4. The reasons for the variation between the consolidated availability and the consumption can be attributed to stock changes, conversion factor (volume/energy) and the provisional data reported by the Source: PPAC

**Note :** LPG shrinkage is being shifted from Non-Energy purpose to Energy Purpose. Since, LPG shrinkage is a transformation process and LPG produced is further used for energy purposes to meet domestic / household energy requirements. Therefore, it has been shifted from 'non energy purpose' to 'energy purpose'

# Energy Balance and Sankey Diagram

## **CHAPTER 7**

### ***Energy Balance and Sankey Diagram***

#### **Commodity Balance**

The purpose of commodity balance is to show the sources of supply and various uses of particular energy product with reference to national territory of the compiling country. The balance is compiled for any energy commodity provided that the commodity remains homogeneous at each point in the balance.

International Recommendations on Energy Statistics (IRES) recommends that the format of energy balance and all applicable concepts are consistently used in the compilation of a commodity balance to ensure data consistency. The major sources for commercial energy in India are coal, oil products, natural gas and electricity. Non-energy producing sectors derive energy from the resources available in primary form such as coal, crude oil, natural gas, hydro-power and nuclear power. Some of the energy resources are converted into other (final) energy products that are used for purposes other than energy generation.

Coal is also used as a final product or intermediate for power generation. Similarly, natural gas is also used directly or as an intermediate in power generation. Many petroleum products, such as HSDO, Naphtha etc. are used as a final product by the non-energy producing sectors and also used for power generation. This indicates that the same energy source can be used in various forms at various stages of consumption. This creates a possibility of over-estimation or under-estimation of energy consumption in totality as well as for different sources.

#### **Energy Balance**

An energy balance is a framework to complete data on all energy products entering, existing and used within a given country during a reference period (e.g. a year). It expresses all data in common energy units, which makes it possible to define a “total” product.

The purpose of compiling an energy balance starting from the various commodity balances are numerous; they are to:

- Provide a comprehensive overview of the energy profile of a country, to monitor energy security, energy markets, relevant policy goals and to formulate adequate energy policies;
- Provide the basis for aggregate socio-economic indicators, as well as for estimates of CO<sub>2</sub> emissions;
- Compare data of different reference periods and different countries;
- Provide a tool to ensure completeness, consistency and comparability of basic statistics;

- Calculate efficiencies of transformation processes, as well as relative shares of different sectors or products in the country's total supply or consumption

An energy balance generally takes the form of a matrix of products and flows, with varying levels of disaggregation, although graphical formats also exist (e.g. sankey diagram).

Two major components of the energy balance statistics are Total Primary Energy Supply (TPES) and Total Final Consumption (TFC) of energy commodity. Within a balance, the total final consumption is disaggregated into sectors, like industry, transport, residential, services and others. However, the level of disaggregation of such energy data is not enough to monitor energy efficiency, as no information is available, for example on the residential or services end uses, nor on the transport vehicle types or segments. The energy balance will therefore be useful to assess the largest consuming sectors within a country where the energy saving potential will have more impact, before starting more detailed collection programmes on data for energy efficiency indicators.

### **A note on Methodology used for Energy Balance**

Energy (in KToe) = Quantity of Commodity \* Conversion factor

where 1 Toe = 41868 MJ

Therefore, Conversion factor = 
$$\frac{\text{Net Calorific Value (NCV)}}{\text{Mega joules per ton of oil equivalent}}$$

where Net Calorific Value (NCV) is in kj per kg and

Net Calorific Value (NCV) = Gross calorific value (GCV) - (% Moisture Content)

The difference between net and gross calorific values are typically about 5% to 6% of the gross value of solid and liquid fuels and about 10% for Natural gas.

Net Calorific Values are, as recommended by IEA for all commodities.

### **Sankey Diagram**

The concept of data visualization in the digital age has revived interest in a style of chart called a Sankey diagram. This style of diagram makes it easy to see the dominant flows within a system and highlights where losses occur. The Sankey diagram is very useful tool to represent an entire input and output energy flow in energy system after carrying out energy balance calculation. The thicker the line, the greater the amount of energy involved.

The data of Energy Balance (Table 7.2) is used to construct the Sankey diagram, in which flows of energy are traced from energy sources to end-use consumption. The resulting diagram provides a convenient and clear snapshot of existing energy transformations in India which can usefully be compared with a similar global analysis. It gives a basis for examining and communicating future energy scenarios.

## Highlights

- In this 30<sup>th</sup> edition of Energy Statistics, attempt has been made to generate the Energy Balance table of India using the domestic conversion factors (especially for Coal). Since Coal has always having the dominant share of Energy resources in India, thus a shift of conversion factors from IEA to Domestic, results in a significant reduction of Energy supplied and consumed in India. Attempt has also been made to generate the final version of Energy Balance table of India from 2012-13 onwards, based on the audited final database, received from all the source Ministries and using the domestic conversion factors.
- In 2021-22 (P), Primary Energy Supply added up to 7,39,386 Kilo Tonne of Oil equivalent (ktoe) (Table 7.2).
- Two major contributors to the total energy supply in the country were Coal which accounted for 56.13% of the total and Crude Oil which accounted for 33.40%.
- In 2021-22 (P), final Energy Consumption (End Use) was 5,25,708 ktoe. The industrial sector was the largest consumer of energy in the country with this sector itself using more than half, i.e., 50.59% of the total final energy consumption.
- Within the industry sector, the most energy intensive industries were iron and steel, which accounted for 15.29% of the industrial energy use followed by Chemicals and petrochemicals 5.36 % and construction 2.09%.
- The consumption of the residential, agriculture, commercial & public sectors, No-specified(others) and non-energy purpose represented 38.53% of the total final consumption in the country, whereas, transport sector accounted for 10.88% of Total Final Consumption.
- The Energy Balance table of India, based on the final audited figures as available from different Ministries and on Domestic conversion factors have been computed from the FY: 2012-13 to FY: 2019-20. The same can be found in *Annexure - V*.

(P): Provisional

Statistical Difference is defined as final consumption + use for transformation processes and consumption by energy industry own use + losses - domestic supply

Final consumption = Total Consumption in Transport + Total Industrial Consumption+Consumption by Other sectors+Non energy Use

\* Include ATF, Pet Coke, Paraffin waxes, petroleum jelly, LSWR, MTBE and reformatte, BGO, Benzene, MTO, CBFS and Sulfur etc.

(P): Provisional

Statistical Difference is defined as final consumption + use for transformation processes and consumption by energy industry own use + losses - domestic supply

Final consumption = Total Consumption in Transport + Total Industrial Consumption+Consumption by Other sectors+Non energy Use

\* Include ATF, Pet Coke, Paraffin waxes, petroleum jelly, LSWR, MTBE and reformatte, BGO, Benzene, MTO, CBFS and Sulfur etc.

## Sustainability and Energy

## ***CHAPTER 8***

### ***Sustainability and Energy***

#### **Sustainability**

The United Nations (UN) General Assembly, in its 70th Session held on 25th September 2015, adopted the document titled “Transforming our World: The 2030 Agenda for Sustainable Development” consisting of 17 Sustainable Development Goals (SDGs) and associated 169 targets. The SDGs are a comprehensive list of global goals integrating social, economic and environmental dimensions of development.

Realizing that Energy is critical for people deprived of the opportunity of access to sustainable energy, Goal 7 with the aim to ensure access to affordable, reliable, sustainable and modern energy to all was adopted as one of the 17 SDGs. The goal also stresses more focused attention to improve access to clean and safe cooking fuels and technologies, improve energy efficiency, increase use of renewable sources and promotion of sustainable and modern energy for all. Energy from renewable resources – wind, water, solar, biomass and geothermal energy – is inexhaustible and clean.

The targets adopted as a part of the Goal 7 of SDGs 2030 Agenda are as follows:

- I. By 2030, ensure universal access to affordable, reliable and modern energy services.
- II. By 2030, increase substantially the share of renewable energy in the global energy mix.
- III. By 2030, double the global rate of improvement in energy efficiency.
- IV. By 2030, enhance international co-operation to facilitate access to clean energy research and technology, including renewable energy, energy efficiency and advanced and cleaner fossil-fuel technology, and promote investment in energy infrastructure and clean energy technology.
- V. By 2030, expand infrastructure and upgrade technology for supplying modern and sustainable energy services for all in developing countries, in particular least developed countries, small island developing states and land-locked developing countries, in accordance with their respective programmes of support.

This Chapter presents some of the concepts related to sustainable energy systems in continuation of the data presented earlier on renewable energy resources in the earlier chapters.

Further, “Energy Indicators for Sustainable Development: Guidelines and Methodology, 2005” by the International Atomic Energy Agency, United Nations Department of Economic And Social Affairs, International Energy Agency, Eurostat And European Environment Agency, has identified a core set of energy indicators, also called Energy Indicators for Sustainable Development, which are designed to provide information on current energy related trends in a format that aids decision making at the national level in order to help countries assess effective energy policies for action on sustainable development. While the importance of these various indicators is recognized and since Social and Environmental indicators require additional levels

of detail than that are presented in Energy Statistics this report is restricted to the economic dimension only and presents some of these indicators in this chapter. The details of the indicators – theme, definition, purpose and measurement method etc. are provided in the Annexures.

## Highlights

- One of the Targets identified by the Sustainable Development Goals focuses on making affordable, reliable and modern energy accessible to all people universally. To ensure the same India has been focusing on availability of electricity to all citizens of the country. As seen, state-wise number of villages electrified as on 31.03.2022 has reached 100% coverage (relative to 2011 census figures for total number of villages in the country). (Table 8.1).
- Sustainable energy systems also focus on increasing energy efficiency in the long run by improving energy intensity besides shifting to cleaner technologies, improving share of renewable energy in a countries energy mix etc.
- Energy Intensity is defined as the amount of energy consumed for generating one unit of Gross Domestic Product (at constant prices). Along with Energy Intensity, the indicator "Per Capita Energy Consumption (PEC)" is the most used policy indicator, both at national and international levels for this purpose. Per-capita Energy Consumption during a year is computed as the ratio of the estimate of total energy consumption during the year to the mid-year population of that year. In the absence of data on consumption of non-conventional energy from various sources, particularly in rural areas these two indicators are generally computed on the basis of consumption of conventional energy (Table 8.2).
- The Energy Intensity (at 2011-12 prices) decreased from 0.2801 Mega joules per rupee in 2012-13 to 0.2245 Mega Joules in 2021-22 (P).

**FIG 8.1 : ENERGY INTENSITY IN MEGAJOULE PER RUPEE FROM 2012-13 TO 2021-22(P)**

- Similarly, Per-capita Energy Consumption increased from 20,874 Mega joules in 2012-13 to 24,453 Mega joules in 2021-22(P).

**Fig 8.2 :Per Capita Energy Consumption in India (Megajoule/Person) from 2012-13 to 2021-22(P)**

- India's Total Emissions from the Energy Sector have increased from 16,51,928 GgCO<sub>2</sub> Equivalent in 2011 to 21,29,428 GgCO<sub>2</sub> Equivalent in 2016 as per the latest estimates by MoEFCC in February 2021. The major sector contributing to total emissions remains Energy Industries with its share increasing marginally from 55.95% in 2011 to 56.66 in 2016 (Table 8.3).
- The Energy Indicators for Sustainability have been re-calculated for the FY : 2012-13 to FY : 202-21, based on the domestic conversion factors and final, audited figures as available from different energy Ministries. The same has been attached under *Annexure- VI*.

			Natural Gas	%	8.11
			Coal	%	56.13
			RE & Others	%	5.52
		Fuel share in TFC	Oil Products	%	39.58
			Natural Gas	%	6.47
			Coal	%	32.74
			Electricity	%	21.21
		Fuel share in electricity	Thermal	%	77.99
			Nuclear	%	2.74
			Hydro	%	8.84
			RE (other than Hydro)	%	10.43
Security	Imports	Net energy import dependency	Overall	%	40.90
			Crude Oil	%	87.71
			Natural gas	%	47.49
			Coal	%	27.95
			Electricity	%	0.44
	Strategic Fuel Stocks	Stocks of critical fuels per corresponding fuel consumption	Coal	%	6.70

Note: The difference in the figures computed by MoPNG and MoSPI arises due to methodological differences - MoSPI using data from supply side and MoPNG using consumption side.

*Definitions of Energy Products and associated concepts*

**1. Solid fuels**

- i. **Hard Coal:** Coals with a gross calorific value (moist, ash-free basis) which is not less than 24 MJ/kg or which is less than 24 MJ/kg provided that the coal has a vitrinite mean random reflectance greater than or equal to 0.6 per cent. Hard coal comprises anthracite and bituminous coals.
- ii. **Lignite:** Brown coal with a gross calorific value (moist, ash-free basis) less than 20 MJ/kg.
- iii. **Coke:** Products derived directly or indirectly from the various classes of coal by carbonisation or pyrolysis processes, or by the aggregation of finely divided coal or by chemical reactions with oxidising agents, including water.
- iv. **Proved Reserves:** A 'Proven Mineral Reserve' is the economically mineable part of a Measured Mineral Resource demonstrated by at least a Preliminary Feasibility Study. This Study must include adequate information on mining, processing, metallurgical, economic, and other relevant factors that demonstrate, at the time of reporting, that economic extraction is justified.
- v. **Indicated Reserves:** An 'Indicated Mineral Resource' is that part of a Mineral Resource for which quantity, grade or quality, densities, shape and physical characteristics can be estimated with a level of confidence sufficient to allow the appropriate application of technical and economic parameters, to support mine planning and evaluation of the economic viability of the deposit. The estimate is based on detailed and reliable exploration and testing information gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes that are spaced closely enough for geological and grade continuity to be reasonably assumed.
- vi. **Inferred Reserves:** An 'Inferred Mineral Resource' is that part of a Mineral Resource for which quantity and grade or quality can be estimated on the basis of geological evidence and limited sampling and reasonably assumed, but not verified, geological and grade continuity. The estimate is based on limited information and sampling gathered through appropriate techniques from locations such as outcrops, trenches, pits, workings and drill holes. Due to the uncertainty that may be attached to Inferred Mineral Resources, it cannot be assumed that all or any part of an Inferred Mineral Resource will be upgraded to an Indicated or Measured Mineral Resource as a result of continued exploration. Confidence in the estimate is insufficient to allow the meaningful application of technical

and economic parameters or to enable an evaluation of economic viability worthy of public disclosure. Inferred Mineral Resources must be excluded from estimates forming the basis of feasibility or other economic studies

## 2. Liquid fuels

- i. **Crude petroleum/Oil** A mineral oil of fossil origin extracted by conventional means from underground reservoirs, and comprises liquid or near-liquid hydrocarbons and associated impurities such as sulphur and metals.

Remark: Conventional crude oil exists in the liquid phase under normal surface temperature and pressure, and usually flows to the surface under the pressure of the reservoir. This is termed "conventional" extraction. Crude oil includes condensate from condensate fields, and "field" or "lease" condensate extracted with the crude oil.

The various crude oils may be classified according to their sulphur content ("sweet" or "sour") and API gravity ("heavy" or "light"). There are no rigorous specifications for the classifications but a heavy crude oil may be assumed to have an API gravity of less than 20° and a sweet crude oil may be assumed to have less than 0.5% sulphur content.

- ii. **Liquefied Petroleum Gas (LPG)** refers to liquefied propane ( $C_3H_8$ ) and butane ( $C_4H_{10}$ ) or mixtures of both. Commercial grades are usually mixtures of the gases with small amounts of propylene, butylene, isobutene and isobutylene stored under pressure in containers.

Remark: *The mixture of propane and butane used varies according to purpose and season of the year. The gases may be extracted from natural gas at gas separation plants or at plants re-gasifying imported liquefied natural gas. They are also obtained during the refining of crude oil. LPG may be used for heating and as a vehicle fuel. Certain oil field practices also use the term LPG to describe the high vapor pressure components of natural gas liquids.*

- iii. **Motor gasoline** A mixture of some aromatics (e.g., benzene and toluene) and aliphatic hydrocarbons in the C5 to C12 range. The distillation range is 25°C to 220°C.

Remark: *Additives are blended to improve octane rating, improve combustion performance, reduce oxidation during storage, maintain cleanliness of the engine and improve capture of pollutants by catalytic converters in the exhaust system. Motor gasoline may also contain bio-gasoline products.*

- iv. **Naphtha** Light or medium oils distilling between 30°C and 210°C which do not meet the specification for motor gasoline.

*Remark: Different naphtha are distinguished by their density and the content of paraffins, isoparaffins, olefins, naphthenes and aromatics. The main uses for naphtha are as feedstock for high octane gasolines and the manufacture of olefins in the petrochemical industry.*

- v. **Kerosene** Mixtures of hydrocarbons in the range C9 to C16 and distilling over the temperature interval 145°C to 300°C, but not usually above 250°C and with a flash point above 38°C.

*Remark: The chemical compositions of kerosenes depend on the nature of the crude oils from which they are derived and the refinery processes that they have undergone. Kerosenes obtained from crude oil by atmospheric distillation are known as straight-run kerosenes. Such streams may be treated by a variety of processes to produce kerosenes that are acceptable for blending as jet fuels. Kerosenes are primarily used as jet fuels. They are also used as domestic heating and cooking fuels, and as solvents. Kerosenes may include components or additives derived from biomass.*

- vi. **Gasoline-type Jet fuels** Light hydrocarbons for use in aviation turbine power units, distilling between 100°C and 250°C. They are obtained by blending kerosene and gasoline or naphtha in such a way that the aromatic content does not exceed 25 per cent in volume, and the vapour pressure is between 13.7 kPa and 20.6 kPa.

*Remark: Gasoline-type jet fuel is also known as "aviation turbine fuel".*

- vii. **Gas oil/Diesel oil** Gas oils are middle distillates, predominantly of carbon number range C11 to C25 and with a distillation range of 160°C to 420°C.

*Remark: The principal marketed products are fuels for diesel engines (diesel oil), heating oils and marine fuel. Gas oils are also used as middle distillate feedstock for the petrochemical industry and as solvents.*

- viii. **Fuel oil** Comprises residual fuel oil and heavy fuel oil. Residual fuel oils have a distillation range of 350°C to 650°C and a kinematic viscosity in the range 6 to 55 cSt at 100°C. Their flash point is always above 60°C and their specific gravity is above 0.95. Heavy fuel oil is a general term describing a blended product based on the residues from various refinery processes.

*Remark: Other names commonly used to describe fuel oil include: bunker fuel, bunker C, fuel oil No. 6, industrial fuel oil, marine fuel oil and black oil. Residual and heavy fuel oil are used in medium to large industrial plants, marine applications and power stations in combustion equipment such as boilers, furnaces and diesel engines. Residual fuel oil is also used as fuel within the refinery.*

- ix. **Lubricants** Oils, produced from crude oil, for which the principal use is to reduce friction between sliding surfaces and during metal cutting operations.

*Remark: Lubricant base stocks are obtained from vacuum distillates which result from further distillation of the residue from atmospheric distillation of crude oil. The lubricant base stocks are then further processed to produce lubricants with the desired properties.*

- x. **Petroleum coke** Petroleum coke is a black solid obtained mainly by cracking and carbonizing heavy hydrocarbon oils, tars and pitches. It consists mainly of carbon (90 to 95 per cent) and has low ash content. The two most important categories are "green coke" and "calcined coke".
- xi. Green coke (raw coke) is the primary solid carbonization product from high boiling hydrocarbon fractions obtained at temperatures below 630°C. It contains 4-15 per cent by weight of matter that can be released as volatiles during subsequent heat treatment at temperatures up to approximately 1330°C.  
Calcined coke is a petroleum coke or coal-derived pitch coke obtained by heat treatment of green coke to about 1330°C. It will normally have a hydrogen content of less than 0.1 percent by weight.

*Remark: In many catalytic operations (e.g., catalytic cracking) carbon or catalytic coke is deposited on the catalyst, thus deactivating it. The catalyst is reactivated by burning off the coke which is used as a fuel in the refining process. The coke is not recoverable in a concentrated form*

- xii. **Bitumen (Asphalt)** A solid, semi-solid or viscous hydrocarbon with a colloidal structure, being brown to black in color.

*Remark: It is obtained as a residue in the distillation of crude oil and by vacuum distillation of oil residues from atmospheric distillation. It should not be confused with the nonconventional primary extra heavy oils which may also be referred to as bitumen. In addition to its major use for road pavements, bitumen is also used as an adhesive, a waterproofing agent for roof coverings and as a binder in the manufacture of patent fuel. It may also be used for electricity generation in specially designed power plants. Bitumen is also known in some countries as asphalt but in others asphalt describes the mixture of bitumen and stone aggregate used for road pavements.*

- xiii. **Refinery gas** is a non-condensable gas collected in petroleum refineries (it is also known as still gas).

### **3. Gaseous fuels**

- i. **Natural Gas:** A mixture of gaseous hydrocarbons, primarily methane, but generally also including ethane, propane and higher hydrocarbons in much smaller amounts and some noncombustible gases such as nitrogen and carbon dioxide.

*Remark: The majority of natural gas is separated from both "non-associated" gas originating from fields producing hydrocarbons only in gaseous form, and "associated" gas produced in association with crude oil. The separation process produces natural gas by removing or reducing the hydrocarbons other than methane to levels which are acceptable in the marketable gas. The natural gas the natural gas liquids (NGL) removed in the process are distributed separately.*

- ii. **Coke-oven gas:** A gas produced from coke ovens during the manufacture of coke oven coke.
- iii. **Biogases:** Gases arising from the anaerobic fermentation of biomass and the gasification of solid biomass (including biomass in wastes).  
*Remark: The biogases from anaerobic fermentation are composed principally of methane and carbon dioxide and comprise landfill gas, sewage sludge gas and other biogases from anaerobic fermentation. Biogases can also be produced from thermal processes (by gasification or pyrolysis) of biomass and are mixtures containing hydrogen and carbon monoxide (usually known as syngas) along with other components. These gases may be further processed to modify their composition and can be further processed to produce substitute natural gas. The gases are divided into two groups according to their production: biogases from anaerobic fermentation and biogases from thermal processes. They are used mainly as a fuel but can be used as a chemical feedstock.*

#### **4. Electricity**

- i. **Installed capacity:** The net capacity measured at the terminals of the stations, i.e., after deduction of the power absorbed by the auxiliary installations and the losses in the station transformers.
- ii. **Utilities:** undertakings of which the essential purpose is the production, transmission and distribution of electric energy. These may be private companies, cooperative organisations, local or regional authorities, nationalised undertakings or governmental organisations.
- iii. **Non-Utilities:** An Independent Power Producer which is not a public utility, but which owns facilities to generate electric power for sale to utilities and end users. They may be privately held facilities, corporations, cooperatives such as rural solar or wind energy producers, and non-energy industrial concerns capable of feeding excess energy into the system
- iv. **Hydro Electricity:** refers to electricity produced from devices driven by fresh, flowing or falling water.

- v. **Thermal Electricity** comprises conventional thermal plants of all types, whether or not equipped for the combined generation of heat and electric energy. Accordingly, they include steam-operated generating plants, with condensation (with or without extraction) or with back-pressure turbines, and plants using internal combustion engines or gas turbines whether or not these are equipped for heat recovery.
- vi. **Nuclear Electricity** is defined as the heat released by the reactors during the accounting period and is obtained by dividing the generation of nuclear electricity by average efficiency of all nuclear power stations.
5. **Production of Energy Products** is defined as the capture, extraction or manufacture of fuels or energy in forms which are ready for general use. In energy statistics, two types of production are distinguished, primary and secondary. Primary production is the capture or extraction of fuels or energy from natural energy flows, the biosphere and natural reserves of fossil fuels within the national territory in a form suitable for use. Inert matter removed from the extracted fuels and quantities reinjected flared or vented are not included. The resulting products are referred to as "primary" products. Secondary production is the manufacture of energy products through the process of transformation of primary fuels or energy. The quantities of secondary fuels reported as production include quantities lost through venting and flaring during and after production. In this manner, the mass, energy and carbon within the primary source(s) from which the fuels are manufactured may be balanced against the secondary fuels produced. Fuels, electricity and heat produced are usually sold but may be partly or entirely consumed by the producer. **comprises gross production, i.e. the amount of electric energy produced, including that consumed by station auxiliaries and any losses in the transformers that are considered integral parts of the station. Included is the total production of electric energy produced by pump storage installations.**
6. **Imports of energy products** comprise all fuel and other energy products entering the national territory. Goods simply being transported through a country (goods in transit) and goods temporarily admitted are excluded but re-imports, which are domestic goods exported but subsequently readmitted, are included. The bunkering of fuel outside the reference territory by national merchant ships and civil aircraft engaged in international travel is excluded from imports. Fuels delivered to national merchant ships and civil aircraft which are outside of the national territory and are engaged in international travel should be classified as "International Marine" or "Aviation Bunkers", respectively, in the country where such bunkering is carried out (see paragraph 5.12). Note that the "country of origin" of energy products should be recorded as a country from which goods were imported.
7. **Exports of energy products** comprise all fuel and other energy products leaving the national territory with the exception that exports exclude quantities of fuels delivered for use by merchant (including passenger) ships and civil aircraft, of all nationalities, during international transport of goods and passengers. Goods simply being transported through a

country (goods in transit) and goods temporarily withdrawn are excluded but re-exports, foreign goods exported in the same state as previously imported, are included. Fuels delivered to foreign merchant ships and civil aircraft engaged in international travel are classified as "International Marine" or "Aviation Bunkers", respectively. Note that "country of destination" of energy products (that is country of the last known destination as it is known at the time of exportation) should be recorded as a country to which these products are exported to.

8. **Losses** refer to losses during the transmission, distribution and transport of fuels, heat and electricity. Losses also include venting and flaring of manufactured gases, losses of geothermal heat after production and pilferage of fuels or electricity. Production of secondary gases includes quantities subsequently vented or flared. This ensures that a balance can be constructed between the use of the primary fuels from which the gases are derived and the production of the gases.

9. **Energy Industries Own Use** refers to consumption of fuels and energy for the direct support of the production, and preparation for use of fuels and energy. Quantities of fuels which are transformed into other fuels or energy are not included here but within the transformation use. Neither are quantities which are used within parts of the energy industry not directly involved in the activities listed in the definition. These quantities are reported within final consumption.

## **10. Non-commercial Energy Sources**

i. **Fuelwood, wood residues and by-products:** Fuelwood or firewood (in log, brushwood, pellet or chip form) obtained from natural or managed forests or isolated trees. Also included are wood residues used as fuel and in which the original composition of wood is retained.

Remark: Charcoal and black liquor are excluded.

ii. **Charcoal** The solid residue from the carbonisation of wood or other vegetal matter through slow pyrolysis.

iii. **Bagasse** The fuel obtained from the fiber which remains after juice extraction in sugar cane processing.

## **11. Other important definitions:**

i. **Gross Domestic Product (GDP)** is the broadest quantitative measure of a nation's total economic activity. More specifically, GDP represents the monetary value of all goods and services produced within a nation's geographic borders over a specified period of time.

ii. **Energy Use** indicates Total Primary Energy Supply (TPES), Total Final Consumption (TFC) and final electricity consumption.

iii. **Transformation/Conversion Losses:** When one form of energy is converted into another form, the amount of losses is referred as transformation/conversion losses.

## *Categorisation of Coal in India*

### *Grading of Coking Coal based on ash content*

<b>Grade</b>	<b>Ash Content</b>
<b>Steel Gr I</b>	Ash content < 15%
<b>Steel Gr II</b>	15% <= Ash content < 18%
<b>Washery Gr.I</b>	18% <= Ash content < 21%
<b>Washery Gr.II</b>	21% <= Ash content < 24%
<b>Washery Gr.III</b>	24% <= Ash content < 28%
<b>Washery Gr.IV</b>	28% <= Ash content < 35%
<b>Washery Gr.V</b>	35% <= Ash content < 42%
<b>Washery Gr.VI</b>	42% <= Ash content < 49%

### *Grades of Semi Coking Coal based on Ash and Moisture content*

<b>Grade</b>	<b>Ash + Moisture content</b>
<b>Semi coking Gr. I</b>	less than 19%
<b>Semi coking Gr. II</b>	Between 19% and 24%

### *Grading of Non-Coking Coal based on Gross Calorific Value (GCV)*

<b>Grade</b>	<b>GCV Range (Kcal/Kg)</b>
<b>G1</b>	GCV exceeding 7000
<b>G2</b>	GCV between 6701 and 7000
<b>G3</b>	GCV between 6401 and 6701
<b>G4</b>	GCV between 6101 and 6400
<b>G5</b>	GCV between 5801 and 6100
<b>G6</b>	GCV between 5501 and 5800
<b>G7</b>	GCV between 5201 and 5500
<b>G8</b>	GCV between 4901 and 5200
<b>G9</b>	GCV between 4601 and 4900
<b>G10</b>	GCV between 4301 and 4600
<b>G11</b>	GCV between 4001 and 4300
<b>G12</b>	GCV between 3700 and 4000
<b>G13</b>	GCV between 3400 and 3700
<b>G14</b>	GCV between 3101 and 3400
<b>G15</b>	GCV between 2801 and 3100
<b>G16</b>	GCV between 2501 and 2800
<b>G17</b>	GCV between 2201 and 2500

## *Measurement Units in Energy Statistics*

### *Physical Units*

Energy products are measured in physical units by their mass, volume, and energy content. The measurement units that are specific to an energy product and employed at the point of measurement of an energy flow are often referred to as "original" or "natural" units. Coal, for example, is generally measured by its mass and crude oil by its volume. On the other hand, cross-fuel tabulations, such as the energy balances, are displayed in a "common" unit to allow comparison across energy products. These "common" units are usually energy units and require the conversion from an original unit through the application of an appropriate conversion factor.

Typical examples of original units are: mass units (e.g., kilograms or metric tons) for solid fuels; volume units (e.g., barrels or litres) or mass units (metric tons) for oil; and volume units (e.g., cubic metres) for gases.

Solid fuels, such as coal and coke, are generally measured in mass units. The SI unit for mass is the kilogram (kg). Metric tons (tons) are most commonly used to measure coal and their derivatives. One metric ton corresponds to 1000 kg.

Volume units are original units for most liquid and gaseous fuels, as well as some traditional fuels. The SI unit for volume is the cubic metre, which is equivalent to a kilolitre or one thousand litres. Other volume units include the British or Imperial gallon (approximately 4.546 litres), United States gallon (approximately 3.785 litres), the barrel (approximately 159 litres), and the cubic foot, which is also used to measure volumes of gaseous fuels.

### *Energy Units*

In the realms of Energy Statistics, the terms - Energy, heat and work are considered to be three facets of the same concept. The coherent derived SI unit of energy, heat and work is the joule (J)- defined as the work done when a constant force of 1 Newton is exerted on a body with mass of 1 gram to move it a distance of 1 metre. Common multiples of the joule are the megajoule, gigajoule, terajoule and petajoule. Other units include: the kilogram calorie in the metric system, or kilocalorie (kcal) or one of its multiples; the British thermal unit (Btu) or one of its multiples; ton of coal equivalent (tce), ton of oil equivalent (toe); and the kilowatt hour (kWh).

Power is the rate at which work is done (or heat released, or energy converted, often measured in the kilowatt hour (kWh), which refers to the energy equivalent of 1000 watt (joules per second) over a one-hour period. Thus, 1 kilowatt-hour equals  $3.6 \times 10^6$  joules. Electricity is usually measured in kWh. Heat quantities, on the other hand, are usually measured in calories or joules.

## **Conversion Factors**

1 kilogram	= 2.2046 pounds
1 Pound	= 454 gm.
1 Cubic metres	= 35.3 cubic feet (gas)
1 Metric ton	= 1 Tonne =1000 kilogram
1 Joule	= 0.23884 calories
1 Mega Joule	= $10^6$ joules = $238.84 \times 10^3$ calories
1 Giga Joule	= $10^9$ joules = $238.84 \times 10^6$ calories
1 Tera Joule	= $10^{12}$ joules = $238.84 \times 10^9$ calories
1 Peta Joule	= $10^{15}$ joules = $238.84 \times 10^{12}$ calories
One million tonnes of Coal	= 15.13 petajoules of energy
One million tonnes of Lignite	= 9.546 petajoules of energy
One million tonnes of oil equivalent (MTOE)	= 42.789 petajoules of energy
One billion cubic meter of natural gas	= 38.735 petajoules of energy
One million cubic meter of natural gas	= 38.735 terajoules of energy
One billion-kilowatt hour of electricity	= 3.60 petajoules of energy

	Gross Calorific Value of Indian Coal ( in Kilo Joule/kg)									
	2012-13	2013-14	2014-15	2015-16	2016-17	2017-18	2018-19	2019-20	2020-21	2021-22

**Metadata: Energy Statistics**

<b>1. Contact</b>	
<b>1.1. Contact organization</b>	National Statistical Office (NSO), Ministry of Statistics & Programme Implementation (MOSPI)
<b>1.2. Contact organization unit</b>	Economic Statistics Division
<b>1.3. Contact mail address</b>	K. L Bhawan, Janpath, New Delhi – 110001
<b>1.4. Contact emails</b>	<a href="mailto:adg-esd-mospi@nic.in">adg-esd-mospi@nic.in</a> <a href="mailto:energyunit-esd@mospi.gov.in">energyunit-esd@mospi.gov.in</a>
<b>1.5. Homepage</b>	<a href="http://www.mospi.gov.in">http:// www.mospi.gov.in</a>
<b>2. Statistical presentation</b>	
<b>2.1 Data sources</b>	
The data contained in this publication has been sourced from the Ministry of Petroleum and Natural Gas, Central Electricity Authority, Office of the Coal Controller, Ministry of New and Renewable Energy and Office of the Economic Adviser, Ministry of Commerce and Industry and National Accounts Division, Ministry of Statistics and Programme Implementation.	
<b>2.2. Data description</b>	
The statistics represent information about the reserves, installed capacity, potential for generation, production, consumption, import, export and wholesale price of different energy commodities and Energy Indicators on Economic Dimension.	
<b>2.3. Sector coverage</b>	
Coal & Lignite, Petroleum & Natural Gas, Renewable Energy Resources and Electricity. (Data Collection Mechanism is given in Annex: V of this publication). The indicators are based on the guidelines/approach followed by International Atomic Energy Agency in their publication "Energy Indicators for Sustainable Development: Guidelines and Methodologies", which was brought out in collaboration with United Nations Department of Economic and Social Affairs (UNDESA), International Energy Agency (IEA), Eurostat and European Environmental Agency (EEA). Also, the choice of indicators was made as per the availability of data from the subject ministries.	
<b>2.4. Data content</b>	
The Statistics are given by type of fuel and energy source. The publication includes analytical indicators viz. Growth Rates, Compound Annual Growth Rates (CAGR), Percentage Distributions and Economic Energy Indicators.	
<b>2.5. Statistical unit</b>	
Data are aggregated appropriately at national and state level.	
<b>2.6. Statistical population</b>	
Data covers all the energy commodity sources.	
<b>2.7. Reference area</b>	
The energy industries of the entire country are covered.	

## **2.8. Time coverage**

In the current publication the data given is for the period 2009-10 to 2018-19 and is based on statistics compiled by the Ministry of Petroleum and Natural Gas, Central Electricity Authority, Office of Coal Controller, Ministry of New and Renewable Energy. The data for Office of the Economic Advisor, Ministry of Commerce and Industry and National Accounts Division has been sourced for the year 2011-12 to 2018-19. Energy Indicators on Economic Dimensions have been compiled for the year 2018-19.

## **2.9. Base period**

2011-12 for WPI and GDP data

## **2.10. Statistical concepts and definitions**

The main Concepts and Definitions and certain Conversion Factors are given in Annex: I & Annex: II respectively. Annex III gives categorization of coal in India. Annex IV gives details of Energy Data Collection Mechanism.

## **3. Unit of measure**

Energy quantities data are recorded in physical units relevant to the product in question; Giga Watt hour (GWh) for electricity, Thousand Metric Tonne (TMT) for petroleum products etc. Prices are indicated by Wholesale Price Index. The Energy Balance is given in Kilo Tonne of oil equivalent (KToE). Consumption and Production of the Energy resources is also given in Petajoules (PJ).

## **4. Reference period**

Reference period of the Publication of "Energy Statistics -2020" is the financial year 2018-19 and the previous financial years since 2009-10. For Energy Indicators reference period is Financial Year 2018-19.

## **5. Institutional mandate**

### **5.1. Legal acts and other agreements**

No legal acts, however, this statistics is collected in view of the mandate of the Ministry in allocation of Business rules.

### **5.2. Data sharing**

The publication is disseminated on the website of the Ministry (MOSPI) and is available free of cost.

## **6. Confidentiality**

### **6.1. Confidentiality – policy and data treatment**

Confidentiality of the data is maintained by the data source ministries.

## **7. Release policy**

### **7.1. Release calendar**

Publication of Energy Statistics is released on MOSPI's web-site in end of March every year.

## **7.2. User access**

MOSPI disseminates Energy Statistics on its website in an objective, professional and transparent manner in which all users are treated equitably. The detailed arrangements are governed by the data dissemination policy of Government of India.

## **8. Dissemination format**

### **8.1. News release**

Publication on Energy Statistics is released annually.

### **8.2. Publications**

Annual publication in pdf format is available on the website of MOSPI.

## **9. Accessibility of documentation**

### **9.1. Documentation on methodology**

Information on the relevant Energy indicators methodology can be found in the publication in Chapter 10.

## **10. Accuracy and reliability**

### **10.1. Overall accuracy**

Data on energy is published on the basis of information received from the source agencies. ESD, NSO compiles and analyses data received from the source agencies and then presents in the form of publication.

## **11. Timeliness and punctuality**

### **11.1. Timeliness**

Preliminary data on energy production and consumption and few energy indicators are available 12 months after the reference year. Final data for the year are published 24 months after the end of the reference year.

### **11.2. Punctuality**

Annual publication on Energy Statistics is released by the end of March every year.

## **12. Data revision**

### **12.1. Data revision – policy**

The annual publication provides data on the last reference year and revisions for the year before. Revisions of entire time series when made by source agencies due to specific survey or data revision are incorporated in due time. The data revision by source Ministries is incorporated in the subsequent edition and hence some of the values may not match with the previous issues of this publication.

### **12.2. Data revision – practice**

Preliminary data on energy production and consumption statistics for the year 2018-19 is published in current publication. Final data will be given in the next publication in March 2021.

## **13. Statistical processing**

### **13.1. Source data**

Energy data are collected from the source agencies at national level and presented in the publication. It is published in the ministry's web-site.

### **13.2. Frequency of data collection**

Annual.

### **13.3. Data collection**

Data is collected through e-mail or by publications brought out by the source agencies.

### **13.4. Data validation**

Checks are carried out to the data before publishing it.

### **13.5. Data compilation**

National figures are compiled by aggregating the data received from the source agencies.

### **13.6. Adjustment**

No seasonal adjustment or temperature correction of the energy consumption is applied.

### Sustainability Energy Indicators of Economic Dimension

The publication “*Energy Indicators for Sustainable Development: Guidelines and Methodology, Vienna, 2005, IAEA*” presents a list of indicators on Social, Economic and Environment dimensions associated with sustainability in Energy.

While the importance of these various indicators is recognized and since Social and Environmental indicators require additional levels of detail than that are presented in Energy Statistics this report is restricted to the economic dimension only.

The economic indicators have **two themes: Use & production patterns and Security**. The first has the sub theme of Overall Use, Overall Productivity, Supply Efficiency, Production, End Use, Diversification (Fuel Mix) and Prices. The second has the sub themes of Imports and strategic Fuel stocks.

#### List of Sustainability Energy Indicators of Economic

Theme	Sub-theme	
<b>Use and Production Pattern</b>	Overall Use	Energy use per capita
	Overall Productivity	Energy use per unit of GDP
	Supply Efficiency	Efficiency of energy conversion and distribution
	Production	Reserves-to-production ratio Resources-to-production ratio
	End Use	Industrial energy intensities Agricultural energy intensities Transport energy intensities
	Diversification (Fuel Mix)	Fuel shares in energy and electricity Non-carbon energy share in energy and electricity Renewable energy share in energy and electricity
	Prices	WPI of energy sources
	Imports	Net Energy Import Dependency
	Strategic fuel stocks	Stocks of critical fuels per corresponding fuel consumption
<b>Security</b>		

## **Theme: Use and Production Pattern**

This theme is further sub classified into sub themes as

- Overall Use,
- Overall Productivity,
- Supply Efficiency,
- Production,
- End Use,
- Diversification (Fuel Mix) and Prices.

### **SUB THEME: OVERALL USE**

#### **Energy Indicator:** Energy Use per Capita

Purpose and Measurement method: This indicator measures the level of energy use on per capita basis and reflects the energy-use patterns and aggregate energy intensity of a society. It is calculated as the ratio of the total annual use of energy to the mid-year population. It may be further classified as follows:

- a) Total Primary energy supply per capita
- b) Total Final consumption of energy per capita
- c) Electricity use per capita

### **SUB THEME: OVERALL PRODUCTIVITY**

#### **Energy Indicator:** Energy Use Per Unit of GDP

Purpose and Measurement method: This indicator reflects the trends in overall energy use relative to GDP, indicating the general relationship of energy use to economic development. This indicator is calculated as the ratio of energy use to economic output. Here Energy Use indicates Total Primary Energy Supply (TPES), Total Final Consumption (TFC) and final electricity consumption and Output is taken as GDP measured in thousand INR. It may be further classified as follows:

- a) Total Primary energy supply per 000' rupees
- b) Total Final consumption of energy per 000'rupees
- c) Electricity Use per 000' rupees

### **SUB THEME: PRODUCTION**

#### **Energy Indicator:** Reserve-to-Production Ratio

Purpose and Measurement method: - The purpose of this indicator is to measure the availability of national energy reserves with respect to corresponding fuel production. Reserves are generally defined as identified (demonstrated and inferred) resources that are economically recoverable at the time of assessment. The indicator provides a basis for estimating future

energy supplies in years with respect to current availability of energy reserves and levels of production.

It is computed by dividing the proven energy reserves of a commodity at the end of a year by the total production of that commodity in that year.

#### **Energy Indicator:** Resources to Production Ratio

Purpose and Measurement method: - The purpose of this indicator is to measure the availability of national energy resources with respect to corresponding fuel production. Total resources include reserves, and hypothetical and speculative undiscovered resources. It provides a relative measure of the length of time that resources would last if production were to continue at current levels.

The lifetime of fuel resources in terms of years by using resources-to-production ratio is computed by dividing the total energy resources of a commodity at the end of a year by the total production of that commodity in that year.

#### **SUB THEME: END USE**

##### **Energy Indicator:** End Use Energy Intensities

###### I. Industrial Energy Intensities-

Purpose and Measurement method: - This set of indicators measures the aggregate energy use of the industrial sector and selected energy intensive industries per corresponding value added. Intensities provide information about the relative energy use per thousand units of output. The set is used to analyze trends in energy efficiency and evaluating trends in technological improvements. It is measured as Energy Use per thousand units of value added by industrial sector and by selected energy intensive industries.

###### II. Agricultural Energy Intensities

Purpose and Measurement method: - This indicator is a measure of aggregate energy intensity in the agricultural sector that can be used for analyzing trends, particularly in renewable and non-commercial energy use. It is measured as Energy Use per thousand units of value added by Agriculture sector.

###### III. Transport Energy Intensities

Purpose and Measurement method: - This indicator is used to monitor trends in energy use in the Transport sector. It is measured as Energy Use per thousand units of value added by Transport sector. The transport indicators measure how much energy is used for moving both goods and people. Transport is a major user of energy, mostly in the form of oil products, which makes transport the most important driver behind growth in global oil demand.

It is evident from the value of the indicator that industrial sector and transport sector are energy intensive. It must be noted that changes in the aggregate indicator can also be due to change in relative output of the sector. Hence, we can say that the difference seen across the time development do not necessarily reflect differences in energy efficiency.

## **SUB THEME: DIVERSIFICATION**

**Energy Indicator:** Fuel share in energy and electricity

- I. Fuel Share in Energy
- II. Fuel Share in Electricity

Purpose and Measurement method: – This indicator provides the share of fuels in TPES, TFC and electricity generation. This indicator is computed by calculating the ratio of consumption or production of the specific energy fuels identified above to total energy use or production with respect to:

- a. TPES,
- b. TFC and
- c. Electricity generation

**Energy Indicator:** Non-carbon energy share in energy and electricity

- I. Non-Carbon Energy Share in Energy
- II. Non-Carbon Energy Share in Electricity

Purpose and Measurement method: – This indicator measures the share of non-carbon energy sources in TPES and electricity generation. Share of non- carbon energy in TPES is computed by calculating the ratio of primary supply of non-carbon energy to TPES. The share of non-carbon in electricity generation is the total electricity generated from non-carbon energy sources divided by total electricity generated.

**Energy Indicator:** Renewable energy share in energy and electricity

- I. Renewable Energy Share in TPES
- II. Renewable Energy Share in TFC
- III. Renewable Energy Share in Electricity

Purpose and Measurement method: – This indicator measures the share of Renewable energy in TPES, TFC and electricity generation. This indicator is computed by calculating the ratio of the consumption and production of renewables to total final energy supply and production. The share of renewables in electricity is the electricity generated from renewables divided by total electricity generated.

## **SUB THEME: PRICES**

**Energy Indicator:** WPI of Energy Sources

Purpose and Measurement method: – This is a price indicator of energy sources and reflects the price change with respect to base year 2011-12. It is to be noted that energy prices are driving forces for incentive or conservation, or efficiency improvements. Also, it shows affordability and therefore is one of the factors responsible for fuel diversification.

## **SUB THEME: SUPPLY EFFICIENCY**

### **Energy Indicator: Efficiency of energy conversion and distribution**

Purpose and Measurement method: – This indicator measures the efficiency of energy conversion and distribution systems in various energy supply chains including losses occurring during electricity transmission and distribution, and gas transportation and distribution. Due to constraint of data availability only the losses in transmission of electricity are used. The indicator is calculated as ratio of losses in transmission of electricity to electricity generated.

*Theme: Security*

## **SUB THEME: STRATEGIC FUEL STOCKS**

### **Energy Indicator: Stock of Critical Fuels per Corresponding Fuel consumption**

Purpose and Measurement method: – The purpose of this indicator is to measure the availability of national stocks of critical fuels, such as oil, with respect to corresponding fuel consumption. Many countries maintain stocks of oil in anticipation of disruptions in oil supply. For some countries, the critical fuel might be natural gas or other types of fuel. In Indian context we have taken coal as critical fuel. The indicator provides a relative measure of the length of time that stocks would last if supply were disrupted and fuel use were to continue at current levels. This indicator is defined by dividing the stocks of the critical fuels maintained by countries by the corresponding annual fuel consumption.

## **SUB THEME: IMPORTS**

### **Energy Indicator: Net energy import dependency**

Purpose and Measurement method: – This indicator measures the extent to which a country relies on imports to meet its energy requirements. This indicator is computed by calculating the ratio of net imports to consumption. Petroleum products are excluded as India is net exporter of them and have considered only the import value of different energy sources to calculate the indicator.

**Energy Balance Table of India from 2012-13 to 2019-20**  
**(Based on Domestic Conversion Factors and Final, Audited data)**

Table - I - Energy Balance of India for 2012-13 (Final)

		Resources-to-production ratio	All	years	416	423	408	400	400	397	385	408	436
			Crude oil	years	20	20	17	17	17	17	18	19	19
			Natural Gas	years	33	40	37	38	40	41	42	44	48
			Coal	years	537	533	503	483	479	472	448	471	492
			Lignite	years	930	977	914	1017	988	979	1033	1093	1214
	End Use	Sectoral Energy Intensities	Industry	toe/000rupees	0.00818	0.00835	0.00863	0.00801	0.00736	0.00732	0.00772	0.00763	0.00754
			Agriculture	toe/000rupees	0.00089	0.00086	0.00096	0.00098	0.00100	0.00098	0.00103	0.00096	0.00097
			Transport	toe/000rupees	0.00820	0.00770	0.00785	0.00828	0.00875	0.00900	0.00920	0.00954	0.00987
		Sectoral Electricity Intensities	Industry	Kwh/000rupees	14.469	14.647	14.899	13.719	13.257	13.376	14.099	14.712	14.517
			Agriculture	Kwh/000rupees	9.674	9.492	10.520	10.716	11.075	10.828	11.360	10.659	10.806
			Transport	Kwh/000rupees	3.284	3.405	3.300	3.167	2.867	2.960	3.038	3.049	2.980
Security	Diversification (Fuel Mix)	Fuel shares in TPES	Crude Oil	%	39.16	39.42	35.78	35.97	36.56	37.27	35.26	33.54	31.64
			Natural Gas	%	9.23	8.32	7.42	7.24	7.47	7.87	7.50	7.58	7.79
			Coal	%	55.09	56.78	59.61	58.04	56.88	55.72	56.98	57.33	57.67
			RE&Others	%	4.04	4.47	4.18	3.82	3.95	4.24	4.33	4.81	5.11
		Fuel share in TFC	Oil Products	%	40.08	38.67	37.58	39.88	41.21	41.55	40.23	40.62	39.03
			Natural Gas	%	6.04	5.84	5.32	5.47	5.83	5.72	5.39	5.76	5.99
			Coal	%	35.97	37.33	38.76	36.19	33.73	33.36	34.97	33.49	34.11
			Electricity	%	17.91	18.16	18.34	18.45	19.24	19.37	19.41	20.12	20.88
		Fuel share in electricity	Thermal	%	81.42	79.87	81.10	83.03	82.64	81.88	80.86	78.61	78.22
			Nuclear	%	2.96	2.91	2.82	2.80	2.69	2.59	2.39	2.86	2.69
			Hydro	%	10.27	11.48	10.12	9.09	8.71	8.51	8.53	9.62	9.43
			RE(other than Hydro)	%	5.34	5.73	5.96	5.09	5.96	7.02	8.23	8.91	9.66
	Strategic Fuel Stocks	Stocks of critical fuels per corresponding fuel consumption	Overall	%	34.21	35.55	37.00	37.98	31.16	40.07	40.64	42.26	42.01
			Crude Oil	%	83.00	83.36	83.49	84.59	85.59	86.07	86.88	87.59	86.56
			Natural gas	%	30.22	33.46	35.60	39.88	43.79	45.66	46.65	52.08	53.53
			Coal	%	23.20	24.91	28.52	27.07	25.46	28.20	28.72	28.94	27.33
			Electricity	%	0.43	0.47	0.39	0.39	0.40	0.34	0.32	0.46	0.60

Note: The difference in the figures computed by MoPNG and MoSPI arises due to methodological differences - MoSPI using data from supply side and MoPNG using consumption side.
